Developer Assignment!

We are looking for great developers, who can learn fast (with the assistant of chatGPT/AI) and get things done without being told much information, and asking many questions.

For that reason we have kept the assignment extremely vague.

Also, the project is crypto related. You can still complete it even if you have no crypto experience, and are a fast learner.

You assignment is to achieve the following:

Create a website, hosted on Vercel, that does the following.

- Pick a blockchain from: Ethereum, Polygon, Solana or Bitcoin. Use their 'devnet/testnet'

- Build a coinflip game, where the user can connect their wallet and then flip a coin on the screen.

- User can select how much tokens from their wallet (SOL, ETH or BTC) they want to risk, and also select a side.

- If it lands on the side that they chose, they get double their tokens back, if it's the wrong side, they get nothing.

- Make the UI/UX (design) nice

- You should test the site before submitting, and it should work. I should be able to test and it should give me tokens back

If you don't understand any of the terms, I want you to ask chatGPT instead of asking me on internshala. This shows me that you can work efficiently without using up other people's time for help.

We really value speed, so you will also be judged on how quickly it takes you to complete the assignment.

When you have completed the assignment, please contact @michaelwbeer on Telegram and send him the following
1. The website url which was hosted on Vercel
2. The github repository so we can look at your code.

If you do well in this assignment, you may be hired. If you get hired, you will be in a team of other elite developers, and you will learn so much and do great things!

The position will be around 10LPA, and we will do everything to make you a great developer.

Good luck,

Michael
